

**Weill Cornell  
Medicine**

You may be eligible if you:

- Are aged 40-65 years
- Have risk factors for Alzheimer's disease
- Have no cognitive impairment or dementia

## The Women's Brain Initiative

Of Weill Cornell Medicine & New York Presbyterian

Approximately 1.5 million women enter menopause each year, with not only familiar symptoms like hot flashes and disrupted sleep, but also potential cognitive and mood changes.

Men also experience hormonal changes leading to andropause.

There is evidence that sex hormones interact with cognitive health and risk of Alzheimer's.

Our new clinical research study is investigating **the effects of menopause and andropause on brain aging and risk of Alzheimer's disease.**

# Weill Cornell Medicine

## What should I expect:

- If you qualify for the study, you will receive a neurological examination with the research physician.
- The physician will review your medical and family history, possibly order laboratory exams.
- You will also receive an endocrinology evaluation and brain imaging scans at no cost to you.
- Based on your test results, the study physicians will make personalized recommendations regarding Alzheimer's prevention.

Call today to see if you qualify:
